Main theorem

Applications

- Let \mathcal{M}_{fg} denote the moduli stack of formal groups.
- Landweber proved that if R is an ordinary commutative ring equipped with a flat map $\text{Spec } R \rightarrow \mathcal{M}_{\text{fg}}$ is flat, there is a homotopy commutative ring E such that $\pi_* E \simeq R[u^{\pm 1}]$, with $|u| = 2$.
- If $k = \overline{\mathbb{F}}_p$, there is one map $H_n : \text{Spec } k \rightarrow \mathcal{M}_{\text{fg}}$ for every $n \geq 0$, but this map is not flat.
- Lubin and Tate proved that the map $\text{LT}'_n \rightarrow \mathcal{M}_{\text{fg}}$, from the infinitesimal neighborhood LT'_n of the k -point H_n , is flat.
- Landweber's theorem begets a homotopy commutative ring E_n such that $E_n = \mathcal{O}_{\text{LT}}[u^{\pm 1}]$; Hopkins and Miller proved that E_n is an E_∞ -ring. This is called Morava E -theory.

The Lubin-Tate tower

- Drinfel'd introduced a tower of finite flat extensions of LT_n :

$$LT_{n,\infty} \rightarrow \cdots \rightarrow LT_{n,2} \rightarrow LT_{n,1} \rightarrow LT_{n,0} = LT_n.$$

 $K(n)$ -local
 E_∞ -rings

Sanath
Devalapurkar

Motivation

Main theorem

Applications

- As an example, suppose $n = 1$; recall that E_1 is just p -completed K -theory, KU_p .

- Moreover,

$$\mathrm{LT}_{n,k} = \mathrm{Spf} Z_p[\zeta_{p^k}].$$

Theorem (Hopkins, unpublished)

The spectrum $KU_p[\zeta_p]$ is not an E_∞ -ring.

- It follows from this that the Lubin-Tate tower when $n = 1$ does not lift to the world of homotopy theory.

A generalization of Hopkins' theorem

Roots of
unity in
 $K(n)$ -local
 E_∞ -rings

Sanath
Devalapurkar

Motivation

Main theorem

Applications

- Let R be an E_n -module; we say that R is $K(n)$ -local if $\pi_0 R$ is (p, u_1, \dots, u_{n-1}) -complete; for instance, $KU_p[\zeta_p]$ is $K(1)$ -local.

 E_∞ -rings

Sanath
Devalapurkar

Motivation

Main theorem

Applications

- Let R be an E_n -module; we say that R is $K(n)$ -local if $\pi_0 R$ is (p, u_1, \dots, u_{n-1}) -complete; for instance, $KU_p[\zeta_p]$ is $K(1)$ -local.
- This definition can be extended to E_∞ -rings which are not necessarily E_n -algebras.

Theorem (D.)

There is no $K(n)$ -local E_∞ -ring R such that $\pi_0 R$ contains a primitive p^k th root of unity for any $n > 0$.

- This generalizes Hopkins' theorem presented above.

The method of proof

- Let R be a $K(n)$ -local E_∞ -ring; then $\pi_0 R$ has operations ψ^p and θ^p , where ψ^p is an additive operation such that for any $x \in \pi_0 R$, we have

$$\psi^p(x) = x^p + p\theta^p(x).$$

Roots of
unity in
 $K(n)$ -local
 E_∞ -rings

Sanath

Motivation

Main theorem

Applications

The method of proof

- Let R be a $K(n)$ -local E_∞ -ring; then $\pi_0 R$ has operations ψ^p and θ^p , where ψ^p is an additive operation such that for any $x \in \pi_0 R$, we have

$$\psi^p(x) = x^p + p\theta^p(x).$$

- θ^p need not be additive; for instance, since $\psi^p(x + y) = \psi^p(x) + \psi^p(y)$, we have

$$\theta^p(x + y) = \theta^p(x) + \theta^p(y) + \sum_{k=1}^{p-1} \binom{p}{k} x^k y^{p-k}.$$

The method of proof

Roots of
unity in
 $K(n)$ -local
 E_∞ -rings

Sanath
Devalapurkar

Motivation

Main theorem

Applications

- Let R be a $K(n)$ -local E_∞ -ring; then $\pi_0 R$ has operations ψ^p and θ^p , where ψ^p is an additive operation such that for any $x \in \pi_0 R$, we have

$$\psi^p(x) = x^p + p\theta^p(x).$$

- θ^p need not be additive; for instance, since $\psi^p(x + y) = \psi^p(x) + \psi^p(y)$, we have

$$\theta^p(x + y) = \theta^p(x) + \theta^p(y) + \sum_{k=1}^{p-1} \binom{p}{k} x^k y^{p-k}.$$

- If $n = 1$, the operation ψ^p is also multiplicative.

The method of proof for $n = 1$

- The proof of Hopkins' theorem uses special properties of the ring $Z_p[\zeta_p]$.

Roots of
unity in
 $K(n)$ -local
 E_∞ -rings

Sanath
Devalapurkar

Main theorem

Applications

The method of proof for $n = 1$

Roots of
unity in
 $K(n)$ -local
 E_∞ -rings

Sanath
Devalapurkar

Motivation

Main theorem

Applications

- The proof of Hopkins' theorem uses special properties of the ring $Z_p[\zeta_p]$.
- But using the formula for $\theta^p(x + y)$ and the identity

$$1 + \zeta_p + \cdots + \zeta_p^{p-1} = 0,$$

one can prove that, if R is a $K(1)$ -local E_∞ -ring such that $\pi_0 R$ contains a p th root of unity, then p is invertible in $\pi_0 R$.

The method of proof for $n = 1$

Roots of
unity in
 $K(n)$ -local
 E_∞ -rings

Sanath
Devalapurkar

Motivation

Main theorem

Applications

- The proof of Hopkins' theorem uses special properties of the ring $Z_p[\zeta_p]$.
- But using the formula for $\theta^p(x + y)$ and the identity

$$1 + \zeta_p + \cdots + \zeta_p^{p-1} = 0,$$

one can prove that, if R is a $K(1)$ -local E_∞ -ring such that $\pi_0 R$ contains a p th root of unity, then p is invertible in $\pi_0 R$.

- This is a contradiction, so we get the desired result when $n = 1$.

The method of proof for $n = 1$

Roots of
unity in
 $K(n)$ -local
 E_∞ -rings

Sanath
Devalapurkar

Motivation

Main theorem

Applications

- The proof of Hopkins' theorem uses special properties of the ring $Z_p[\zeta_p]$.
- But using the formula for $\theta^p(x + y)$ and the identity

$$1 + \zeta_p + \cdots + \zeta_p^{p-1} = 0,$$

one can prove that, if R is a $K(1)$ -local E_∞ -ring such that $\pi_0 R$ contains a p th root of unity, then p is invertible in $\pi_0 R$.

- This is a contradiction, so we get the desired result when $n = 1$.
- However, this uses the multiplicativity of ψ^p when $n = 1$, and we do not have this luxury for $n > 1$.

The general case

Roots of
unity in
 $K(n)$ -local
 E_∞ -rings

Sanath
Devalapurkar

Motivation

Main theorem

Applications

- Instead, we use a recent theorem of Hahn's, which states that if R is a $K(n)$ -local E_∞ -ring such that the " $K(1)$ -localization" $L_{K(1)}R$ of R is trivial, then R itself is trivial.

The general case
